

If you need a mammogram, there is no better place to be than Mercy.

3D mammography is now available at Mercy St. Francis Hospital. 3D data shows a 15-20% increase in cancer detection and 30% reduction in patient callbacks. Enhanced 3D imaging provides:

- **Earlier detection.** Radiologists can carefully go through layers of breast tissue on images to more accurately screen for and pinpoint the size, shape and location of potential breast cancers. Dense breast tissue can sometimes hide problem areas. Fine details are more clearly visible on 3D mammograms.

Breast cancers caught in the initial stages are less likely to require extensive surgery or chemotherapy and are more likely to have positive outcome.

- **Fewer false alarms.** With more clear and precise full breast images, radiologists can better distinguish harmless abnormalities from real tumors, which means less anxiety for patients and lower out-of-pocket costs for diagnostic testing.

Mercy St. Francis Hospital mammograms are read by dedicated, fellowship trained breast radiologists.
